ECLYPSE Connected Thermostat (ECY-STAT)

Quick Start Guide
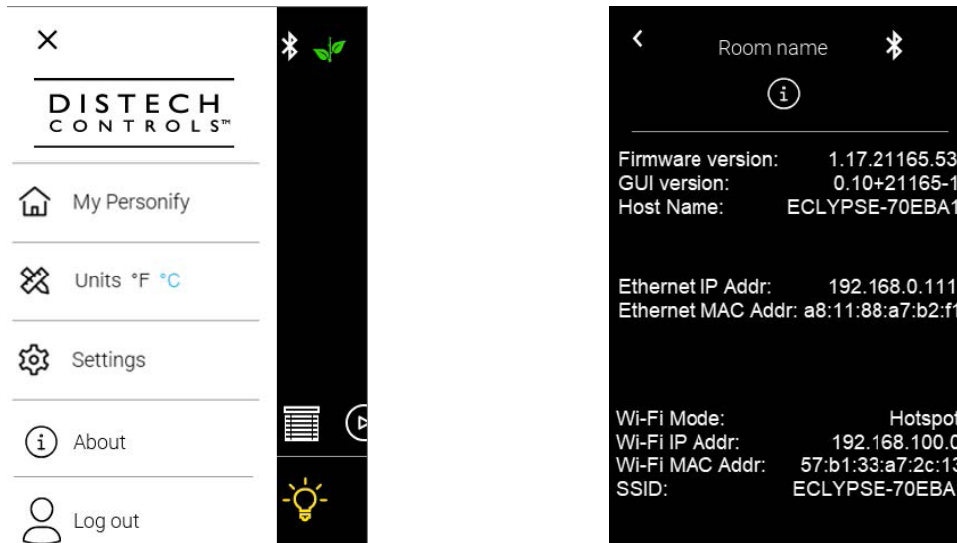

General Information

Default User Credentials

Use the following credentials to access the ECLYPSE Web Interface:
Username: admin
Password: admin
This password is only valid for a first-time connection and you will be prompted to change it after your first login. Please ensure note down the changed password.

Locating the Default Network Configurations on the ECY-STAT (*Home > About*)

Default IP Configurations

The default WiFi IP address for the ECY-STAT Hotspot is 192.168.0.1.
The ECY-STAT is also automatically set in DHCP mode and requires a connection to a router acting as DHCP server to communicate to a network. This setting may be changed through the ECLYPSE Web Interface.

Resetting WiFi Configurations

The Reset Wi-Fi Configuration option will re-activate the Hotspot on the ECY-STAT. It is used when an ECY-STAT in Wi-Fi client mode is unable to connect to its Wi-Fi network, because of a wrong password, for instance. To perform this, select Main Menu > Settings > Advanced Settings (you may have to enter your login credentials again) > Reset Wi-Fi Configuration.

Connection Procedures

Follow these simple steps to get started with the ECLYPSE Connected Thermostat:

There are two networking methods to connect to an ECY-STAT for the first time:
- Wi-Fi.
- Wired (Ethernet connection to a router that will act as a DHCP server).

Once you have connected the thermostat(s) to a network, configure the thermostat.

Option A: Wi-Fi Hotspot Connection

1 On your PC or wireless device, connect to the wireless hotspot named *ECLYPSE-XXYYZZ* where XXYYZZ are the last 6 hexadecimal characters of the controller's MAC address.

2 Enter the default password for the hotspot: **eclypse1234**.

3 Enter the following URL in your web browser's address bar (Google Chrome is recommended): https://192.168.0.1 to access the ECLYPSE Web Interface.

4 a. Set up the ECY-STAT to communicate as a client with your router.

b. Alternatively, set up the ECY-STAT with a static IP according to your network, in the absence of a DHCP server. Consult your IT department if you need help with this configuration.

## Option B: Wired IP Connection using DHCP Server

⚠ If no DHCP server is available, use Option A with Static IP configuration according to your network.

1 Plug both the ECLYPSE Connected Thermostat and your PC to a router acting as DHCP server.

2 Make sure your PC is on the same IP subnet as the ECLYPSE controller. Consult your IT department if you need help with this configuration.

3 Refer to the *About* screen in the *Main Menu* user interface and enter the Ethernet IP address in your web browser's address bar (Google Chrome is recommended) to access the ECLYPSE Web Interface.

📄 You should allow one (1) minute after the home screen is displayed for the ECY-STAT to fully boot up before accessing the Web Interface.

Next Steps...

Once you have connected the ECY-STAT(s) to a network, you may proceed with the configurations using Distech Controls' XpressNetwork Utility to perform batch operations such as batch discovery, IP or WiFi configurations...

Refer to the ECLYPSE Connected Thermostat (ECY-STAT) User Guide for more information.
